

TECHNICAL & SAFETY COMMITTEE

INTERNATIONAL PARACHUTING COMMISSION (FAI)

Technical & Safety Information Notice No.	05/2011 Virgil AAD W.N. 40
Date of Issue	06 October 2011
Subject Matter and Applicability	VIGIL AAD CUTTERS EMERGENCY PRODUCT SERVICE BULLETIN # PSB-7 SUBJECT: Inspection of Vigil AAD Cutters produced in October 2007. Part No. - 9582006 Date of Manufacture – 10-07 (mm-yy)
Background Information	<p>BACKGROUND: The following incident occurred on the 14th September 2011 at the Saint-Jean Chrysostome (Canada) drop zone. A skydiver failed to deploy his main canopy and manually pulled his reserve handle with insufficient altitude to fully deploy the reserve canopy. During the investigation of the incident it was discovered that the loop was neither cut nor trapped by the cutter.</p> <p>In the preliminary report prepared by the Royal Military Academy, it was stated that the knife blade was missing. (See the separate Royal Military Academy report.) Vigil R&D has confirmed that the electronics worked correctly and fired the cutter, but because of the absence of the knife blade, the closing loop could not be cut. This cutter was part of a production batch of 299 pieces, produced in October 2007. (See Photo 1.)</p> <p>A person other than the usual person at the relevant cutter assembly post was working at the post at the time during which the October 2007 batch was manufactured. The cutter manufacturer has confirmed that the failure to install the knife blade was caused by error during the cutter assembly process.</p> <p>This appears to be an isolated case. We are not aware of any similar assembly failure in any of the cutters which the cutter manufacturer has produced for any of their customers, including NASA and the US Armed Forces.</p> <p>A group of 15 cutters from that batch have been A group of 15 cutters from that batch have been activated by the Royal Military Academy for test purposes, and all worked to according to specifications. (See the separate Royal Military Academy report.)</p> <p>In the interest of safety, AAD has decided to recall all cutters from this October 2007 cutter batch and to replace all those cutters free of charge. The removed cutter must be returned to AAD sa/nv or Vigil USA, LLC once the replacement cutter has been received. (Please contact AAD sa/nv or Vigil USA, LLC for return information and instructions). This will enable us to personally examine and analyze as many cutters as possible from this batch in order to verify that this, in fact, has been an isolated incident.</p>

In the interest of additional safety, we have devised a field test, which can be performed on any Vigil cutter, using a magnet to confirm the presence or lack of a knife blade. It can be done using any magnet on any cutter. Either a small (see Photo 2A) or a larger (see Photo 2B) magnet may be used. If there is a knife blade present, the magnet will be attracted to the knife blade.

Note: All Cutters manufactured from June 2008 have been x-rayed as part of our quality control process, and we have confirmed that the knife blade is present.

Compliance

Because of the seriousness of this matter, this Emergency Product Service Bulletin must be complied with before the next jump on all Vigils with the following serial numbers (See List A below, which identifies the affected Vigils by the original gold Q.C. hologram numbers). **Please note that this list is not exhaustive since some cutters may have been removed from the original Vigil for which they were provided and may have been used, without our knowledge, as replacements on other Vigils.** Some cutters may have a silver hologram because they were issued from stock or as replacements via our dealers. Therefore, verification of the Date of Manufacture ("DOM") of the cutter must be performed at the time of the next reserve repack. **Every cutter found with a DOM of 10-07 (see Photo 1) must be replaced before the next jump, and the cutter which was removed must be returned to Vigil.** (Please contact AAD sa/nv or Vigil USA, LLC for return information and instructions).

For additional safety, we highly recommend that the magnet test be performed on each cutter manufactured prior to June 2008.

Preliminary Statement

We received the complete VIGIL unit S/N 11258 on September 22, 2011 and handled the electronic unit the same day over to A.A.D. nv/sa for the infrared download and analysis of the data that could have been stored in the unit's permanent memory during jump 288.

For the investigation of the cutter we decided to make an X-ray photograph. In this manner the cutter has not to be damaged and stays in its original form as he was found after the jump (X-Ray = NDI: Non Destructive Investigation).

We received from A.A.D. nv/sa also X-ray photos of cutters taken by the manufacturer and supplier STRESAU. STRESAU has made X-ray photos of every produced cutter as additional quality control started from the production of the cutters in June 2008.

The cutter in the Vigil unit S/N 11258 was produced in October 2007 (only a lot of 299 cutters) and thus before the extra quality control with X-ray photos.

However, we can compare a cutters X-ray of November 2009 with the received cutter of unit S/N 11258 that we have photographed. There are no changes in the design between October 2007 and November 2009.

The two X-ray photos on **figure 1** show a comparison of the two cutters. On the left side of the figure we see an X-ray of a cutter produced in November 2009; in the middle of the figure the cutter of unit S/N 11258 after jump 288 that we have photographed. For the clearness we have added a normal photo of the cutter right on **figure 1**. On the bottom of **figure 1** we have added a second normal photo showing the DOM number (Date of Manufacturing): 10-07 or October 2007.

On the left X-ray photo we can clearly distinguish the different parts of the cutter:

- the anvil on the top for the energy absorption of the cutting knife;
- the loop hole;
- the cutter knife;
- the fuse (igniter) with the powder for the pressure generation;
- sealing-crimp
- Kevlar cable lock-pen

On the X-ray photo of the cutter of S/N 11258 we can see that the cutter knife is missing.

A.A.D. - VIGIL S/N 11258 – Jump 288
Preliminary Report

Preliminary conclusions

A.A.D. nv/sa stated that this cutter is from the only batch of 299 cutters which were produced in October 2007.

The cutter from Vigil unit S/N 11258 is currently in the possession of the Royal Military Academy.

We have also performed a firing test on 15 cutters from that same production batch. All those cutters performed correctly to specifications and cut the loop without tension.

This investigation together with possible new elements will be covered in a final report.

In the meanwhile, it is absolute necessary that A.A.D. nv/sa performs a recall action of the 283 (299 – 16) cutters still in the field which were produced in October 2007.
